PORTFOLIO CASE STUDY

Digital Government Services for a Greek Municipality

Five services

One operating model

Evidence before scale

Service prioritisation, target architecture, governance, security, privacy and implementation roadmap

SPIROS GROUZTIDIS

Public English edition, October 2026

Greek digital public services

2025 RESIDENT PERSPECTIVE

78%

of Greek respondents said digitalisation of public and private services makes their lives easier

01 — **National progress**

Greece continues to expand digital public services and identity infrastructure.

02 — **Coverage gaps**

The 2025 report still identifies services that are not fully available online.

03 — **Local constraint**

Municipal delivery depends on legacy systems, staffing, procurement and sustainable ownership.

04 — **Inclusion**

Digital skills and assisted access remain material service-design requirements.

Case definition and assumptions

Subject

A hypothetical medium-sized Greek municipality

Decision

Which services should launch first, and what shared controls must exist before scale?

Evidence boundary

Literature, official policy and law, scenarios and explicit design assumptions

01 **No primary research**

No resident survey, staff interview or live-service telemetry

02 **No vendor selection**

The architecture describes capabilities and boundaries

03 **No measured benefits**

Scores and capacity figures remain hypotheses

04 **No legal opinion**

Greek implementation and service-specific scope require review

Prioritisation method

30% — **Citizen value**

Resident effort, delay and uncertainty

25% — **Operational benefit**

Repetitive work, error and queue pressure

20% — **Feasibility**

Technology maturity and dependencies

15% — **Delivery simplicity**

Integration, procurement, rollout and support

10% — **Compliance simplicity**

Privacy, legal and audit complexity

Score

1 to 5

Higher is better

Delivery simplicity uses a high score for lower implementation effort.

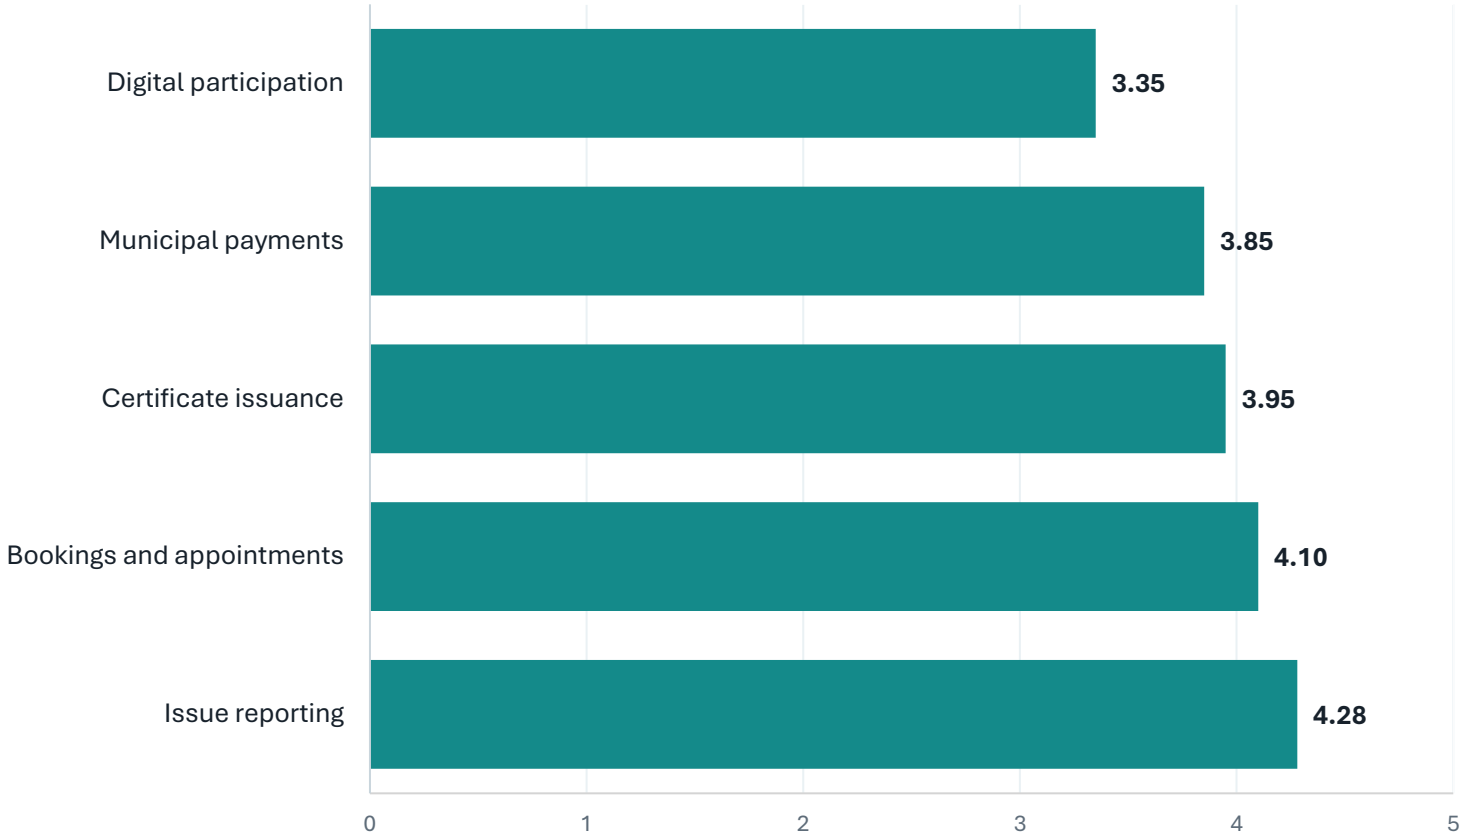

The ranking is reproducible from the CSV file and standard-library Python script in the repository.

Service portfolio and delivery waves

Rank	Candidate service	Score	Wave	Main dependency
1	Infrastructure issue reporting	4.28	Pilot	Workflow ownership
2	Facility booking and appointments	4.10	Pilot	Calendar and resource ownership
3	Digital certificate issuance	3.95	Integrate	Trusted identity, registry and signing
4	Municipal debt payments	3.85	Integrate	ERP, payment provider and reconciliation
5	Digital participation platform	3.35	Expand	Moderation and policy ownership

Pilot services test workflow, content, accessibility and ownership before identity, records and payments raise the control burden.

Weighted service ranking

Interpretation

4.28

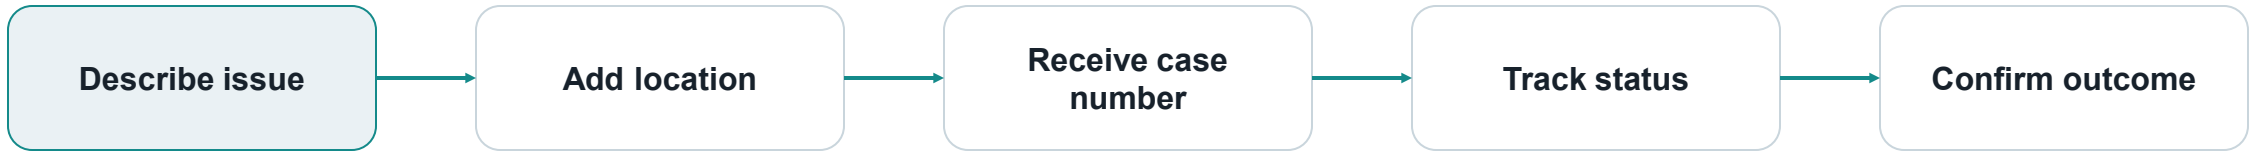

Highest score

Issue reporting combines visible resident value with manageable integration and compliance dependencies.

The score supports sequencing. Discovery can still change the order.

Infrastructure issue reporting pilot

Resident journey

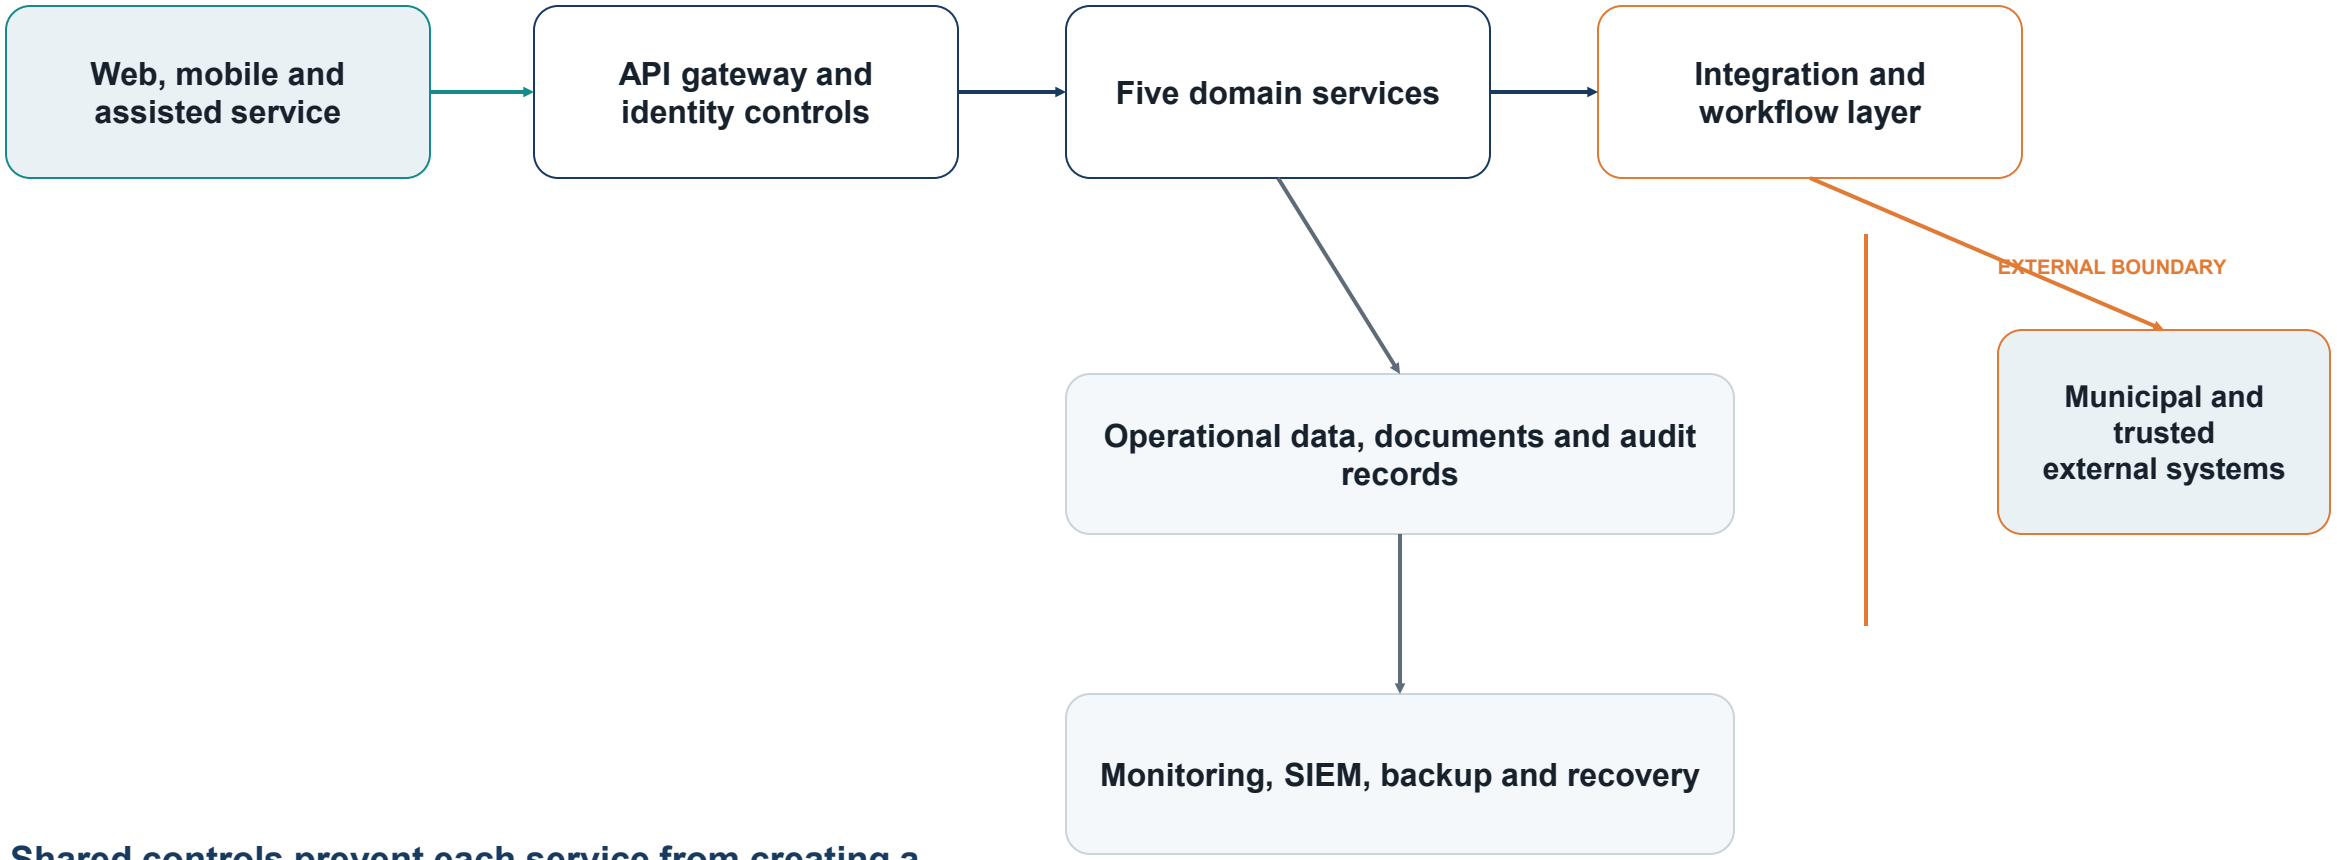

Municipal workflow

Pilot evidence

Completion rate, status accuracy, accessibility findings, support demand, time to assignment and closure quality

Target service architecture

Shared controls prevent each service from creating a separate identity, logging and recovery model.

Integration and trust boundaries

Trusted identity

Resident authentication and verified attributes

Municipal ERP and registries

Authoritative obligations, records and status

Payment provider

Hosted payment and transaction confirmation

Government interoperability

Evidence exchange through governed interfaces

Evidence required at every interface

01 Named data authority and service owner

02 Versioned contract and failure behaviour

03 Authentication, authorisation and logging

04 Reconciliation and retry handling

05 Support and incident escalation

06 Export, retention and supplier exit

Security, privacy and resilience controls

Identity and access	MFA for staff, least privilege, protected recovery and access review
Data protection	Purpose, minimisation, lawful basis, retention, deletion and DPIA where required
Application security	Validated input, secure development, dependency control and independent testing
Detection and response	Protected logs, monitoring, incident roles and regulatory notification workflow
Continuity	Tested backups, recovery objectives, supplier escalation and exercise evidence

Control statements become useful only when an owner can show testable evidence.

Accessibility and assisted service

Public services must remain usable when a resident cannot complete the digital path independently.

Perceivable	Operable	Understandable	Robust
Meaningful structure, alternatives and readable content	Keyboard completion, visible focus and workable timing	Plain instructions, clear errors and predictable status	Compatibility with assistive technology and tested documents

Assisted channel

Staff can complete the same outcome through a documented route without penalising the resident.

Acceptance evidence

Audit, user testing, published statement, feedback route and funded remediation ownership

Service operating model

Role	Accountability	Evidence
Service owner	Outcome, policy, funding and release acceptance	Service standard and benefit review
Product lead	Discovery, backlog, user evidence and delivery coordination	Prioritised backlog and research evidence
IT and architecture	Integration, reliability, support and technical ownership	Architecture decisions and operational runbook
Security and DPO	Risk, privacy, incident and control assurance	Threat model, privacy records and test evidence
Accessibility lead	Acceptance, monitoring and remediation	Audit, testing and accessibility statement
Supplier	Build, documentation, support and contractual evidence	Working service, documentation and exit support

Project governance ends at delivery. Service governance continues through operation.

Four-phase implementation roadmap

Foundation

Months 0–2

01

Owners, baselines, architecture and control plan

Pilot

Months 3–5

02

Issue reporting and booking for a limited audience

Integrate

Months 6–10

03

Certificates and payments connected to trusted systems

Expand

Months 11–14

04

Participation and portfolio improvement

Each phase ends with evidence for user need, accessibility, operations, recovery, control effectiveness and funded ownership.

Benefits, metrics and limitations

Access	Completion rate by channel	**Speed**	End-to-end completion time
Quality	Rework and rejected requests	**Inclusion**	Accessibility defects and assisted demand
Reliability	Failures, availability and recovery	**Efficiency**	Handling time and avoidable contact

Illustrative capacity scenario

2,000 monthly requests, 50% digitised, 10 minutes saved → **≈ 167 staff hours per month**

Arithmetic illustration only. Real benefits depend on demand, exceptions, channel shift and operating cost.
